

Real Time Theft Alert for Self Storage Facilities

Wade / Garcia & Associates, Inc. provides business RFID real time security alert systems, including hardware and software, to help you secure, monitor and alert you about security incidents on your facility protecting your customers valuables, including access control!

- Real-time tracking and instant alerts with video integration on your mobile device or PC
- Rule and Zone based security of customers valuables in difficult and busy environments
- Market your facility as the leader in security

Introducing **Self Storage Alert System ("SSAS")**; an Information System for Self-Storage industry that is now available to all self-storage facilities across the country. It caters to the complete facility security automation need, including access control. The SSAS is a fully integrated, intelligent, user-friendly, robust, online and offline software solution. Our unique offering is real time security alerts of incidents to your mobile device or PC that integrates to your existing access management system and video security.

Security Alerts Overview

The assets to be monitored require a small RFID tag or I. D. badge attached to the asset and carried by the customers. We provide the hardware devices and the associated software so that you can then view the status and location of assets and individuals from anywhere over the internet. The Smart in Smart Tag is that our software knows if a customer is on site, knows where his unit is and knows where he is supposed to be and knows where he should not be. Several smart tags are also provided to each unit allowing them to invisibly protect the contents of their unit. If the customer is not on the premise and their valuables move just a few feet and instant alert is sent to the facility management allowing real time security alerting. We integrate with most video surveillance platforms to provide instant access to what is happing at the unit in question on your mobile device or while at your computer in the office or miles away.

- 1. Unit owners have Access Tag, Key Ring or Wallet Card
- 2. Assets have nearly invisible Smart Tags Applied
- 3. Reader constantly monitors assets and traffic
- 4. Server applies rules to determine alerts
- 5. Server only sends qualified alerts, No false alerts
- 6. Alert can integrate with your video system

Smart Tag

SSAS is a custom version for the Self Security industry using the Smart Tag platform now in use in several other industries. Smart Tag is the brand name of the active real-time location and monitoring and alerting system, which incorporates both hardware and software in an integrated solution. Smart Tag is a highly configurable system that provides superior indoor positional accuracy to all other systems as it uses patented tri-technology allowing the RFID reader to communicate with the intelligent tag in order to ascertain movement and location of the item associated with the tag with 100% accuracy. The Smart Tag will locate and record the movements of people and objects anywhere within its predefined reader network. It can govern those movements with a system of rules based on associated events and actions such as an asset passing into a particular zone within the building.

Smart Tag is scalable and can be customized to meet the users' specific process requirements. Smart Tag can be installed as a wireless system or wired system using Ethernet TCP/IP, or a combination of the two, to send positional data back to the central system with the reasonable implementation costs. With an appropriate password, authorized personnel can then access the server to view the location of those assets or people from anywhere within the organization.

SSAS Smart Tag solution provides these benefits:

- Rules based Real Time Alerts of incidents
- Integrates with your current video platform
- Asset and Item Protection
- Secure Facilities improves your branding
- Dwell Time
- Area Detection
- Access Control
- People and Asset Visibility
- The SSAS will integrate with any of your current access control software such as SiteLink, Space Manger and Tredds filling the gap to your current security solution.

We can integrate with most Self-Storage software including

Proven Technology:

The complete Smart Tag solution is currently implemented in many schools to ensure the security and location of students. The combination of hardware, software that is rule based and real time alerts to situations makes Wade Garcia's Smart Tag the preferred solution for schools in Texas and New Jersey to date. Now we have taken this proven design and created the complete solution for the Self-Storage industry.
